I'm new to Oracle and have installed Oracle 11g Express on WinXP on my home laptop, and want to get some experience with a couple of queries. Using the Oracle instance and a MySQL server, I can connect to the Oracle instance using the OCI drivers just fine, but it's been a long time since I've used.NET so I am a little rusty. I've created an app that uses Visual Studio 2008 (my dev environment), C#, and a SQL Server Express 2008 database. I have a pretty straightforward table called "Foo" that looks like this: +-----+-----+ | code | data | +-----+-----+ | 1 | 2 | 1 | 2 | 4 | 1 | 3 | 5 | 1 | 4 | 6 | +-----+-----+ The Foo table is linked to my SQL Server database through a SQL Server to Oracle bridge. I have a web page on my laptop that allows the user to enter a code (1-4) and click on a button that will update Foo. My ASP.Net app lives on the same server as my Oracle instance. I'm completely blanking on how to set up an Oracle connection from within the .Net app. I saw the following link: but I'm a little confused at how to translate the instructions to my setup. In my case, I know that I'd need an Oracle client installed on my laptop, but what else do I need? And what is the difference between the JDBC OCI and ODBC OCI drivers? When I do an "open connection" in the .Net app, I get this: Server=my.machine.domain/mymachine is either not registered in the database, or it does not have authorized access to this resource. And I can't figure out what information I'd need to input to that Connection string so it works. Any guidance in the right direction would be greatly appreciated.

A Brand New Life PC Game.Q: JPA2: how to handle SQL Null Values in OrderBy In my JPA2 query, I am trying to order on an user name field. I want to return all of the results, and order on the user name. The problem is that the user can have no records, so I get a NULL value. This means that the name (column in the database) is ordered as NULL instead of as what it is ordered by in the database (user name). Is there some way to preserve the NULL value ordering but still use the JPA2 orderBy? I tried to do this: select t from Telephone t where t.entityId = :entityId order by t.userName and CASE f678ea9f9c
